SYNTHETIC TEST REPORT B — FICTIONAL

Diagnosis: Colorectal adenocarcinoma, right-sided. The tumour is microsatellite instability-high (MSI-H) and shows MMR deficiency (dMMR). TMB 41 mutations/Mb. Sequencing of the tissue sample detected a BRAF V600E mutation (variant allele fraction 33%, depth 745x) and a PIK3CA p.Glu545Lys alteration (VAF 29%). RNF43 p.Gly659ValfsTer41 was also observed. KRAS and NRAS: no mutation.
